

## Computing powers of a number

Although most languages have a builtin pow function that computes powers of a number, you can write a similar function recursively, and it can be very efficient. The only hitch is that the exponent has to be an integer.

Suppose you want to compute  $x^n$ , where  $x$  is any real number and  $n$  is any integer. It's easy if  $n$  is 0, since  $x^0 = 1$  no matter what  $x$  is. That's a good base case.

So now let's see what happens when  $n$  is positive. Let's start by recalling that when you multiply powers of  $x$ , you add the exponents:  $x^a \cdot x^b = x^{a+b}$  for any base  $x$  and any exponents  $a$  and  $b$ . Therefore, if  $n$  is positive and even, then  $x^n = x^{n/2} \cdot x^{n/2}$ . If you were to compute  $y = x^{n/2}$  recursively, then you could compute  $x^n = y \cdot y$ . What if  $n$  is positive and odd? Then  $x^n = x^{n-1} \cdot x$ , and  $n-1$  either is 0 or is positive and even. We just saw how to compute powers of  $x$  when the exponent either is 0 or is positive and even. Therefore, you could compute  $x^{n-1}$  recursively, and then use this result to compute  $x^n = x^{n-1} \cdot x$ . What about when  $n$  is negative? Then  $x^n = 1/x^{-n}$ , and the exponent  $-n$  is positive. So you can compute  $x^{-n}$  recursively and take its reciprocal. Putting these observations together, we get the following recursive algorithm for computing  $x^n$ :

- The base case is when  $n = 0$ , and  $x^0 = 1$ .
- If  $n$  is positive and even, recursively compute  $y = x^{n/2}$ , and then  $x^n = y \cdot y$ . Notice that you can get away with making just one recursive call in this case, computing  $x^{n/2}$  just once, and then you multiply the result of this recursive call by itself.
- If  $n$  is positive and odd, recursively compute  $x^{n-1}$ , so that the exponent either is 0 or is positive and even. Then,  $x^n = x^{n-1} \cdot x$ .
- If  $n$  is negative, recursively compute  $x^{-n}$ , so that the exponent becomes

positive. Then,  $\mathbf{x}^n = \mathbf{1}/\mathbf{x}^{-n}$ .
