

Conclusion

In this lesson, we'll wrap up what we have learned in the chapter.

In this chapter, we learned how we can use Profiling to analyze the performance of an app and identify leaks and then provide a better version removing those performance leaks. This performance improvement becomes more important as our applications become larger and have more components.

I hope you have gained knowledge throughout this chapter and that the examples I have used were beneficial for you.

In the next chapter, we'll study lazy loading and how it's useful when the size of your application gets bigger.
