

Interesting Experiments

You can get a firm grasp on your knowledge and understanding by thinking about the interesting experiments that have been discussed in this lesson!

1. Try locating the nearest AWS region to you and note down its identifier.
2. Try creating a new profile for development, using a new set of access keys.
3. Change the default output format for AWS command line tools to `text` or `table` and see how it impacts the commands used to verify that a profile is valid.

You'll start with the creation of a web service using AWS Lambda in the next chapter. See you there!
