

# How it Works: Sending and Processing Form Data

In this lesson, we will understand the workings behind the previous exercise.  
Let's begin!

## WE'LL COVER THE FOLLOWING

- HOW IT WORKS
- Complete live demo at your service!

## HOW IT WORKS #

The previous lesson's exercise demonstrated that your form is really sent to the server page specified in the action attribute of the form. In **step one** you defined the server page,

formprocessor.html

```
<!DOCTYPE html>
<html>
<head runat="server">
  <title>Form Processor</title>
</head>
<body>
  <h1>This page was accessed from a form.</h1>
</body>
</html>
```

and in **step two** you directed the registration form to this page.

index.html

```
<form action="formprocessor.html">
```

Right now, the server page did not extract any form information, it simply indicated that it received the form from the browser.

# Complete live demo at your service! #

The complete implementation of the exercise is given below for you to play around and experiment with.

```
<!DOCTYPE html>
<html>
<head runat="server">
  <title>Form Processor</title>
</head>
<body>
  <h1>This page was accessed from a form.</h1>
</body>
</html>
```

---

In the *next lesson*, we'll get acquainted with how to catch data at the server.

See you there! :)
