

Exercise 2: Computing Cubes

This exercise requires you to compute cubes of variables passed

WE'LL COVER THE FOLLOWING ^

- Problem Statement
- Example

Problem Statement

Write a *method* `void computeCubes` which:

- takes three integers `num1`, `num2`, `num3` as input.
- computes the **cube** of all **three** values.

This method is `void` type hence doesn't *return* any values. How will you get the updated values of `num1`, `num2` and `num3` ?? Hmmmm...

Hint: Think in terms of the pass by reference method of passing values.

Example

Input:

```
num1=4,num2=2,num3=5;
```

Output

```
Value of num1 is: 64  
Value of num2 is: 8  
Value of num3 is: 125
```

Write your code below. It is recommended that you try solving the exercise yourself before viewing the solution.

Good Luck!

```
using System;
class Exercise1
{
    public static string computeCubes( int num1, int num2,  int num3)
    {
        //write your code here
        return "";
    }
    public static string test(int num1, int num2, int num3){

        string ans="xyz"; //change this string to return the correct answer

        //call computeCubes function here
        ans=computeCubes(num1,num2,num3);

        return ans;
    }
}
```
