

Mobile Services

Discuss the AWS Mobile Services & AR&VR.

Mobile Services

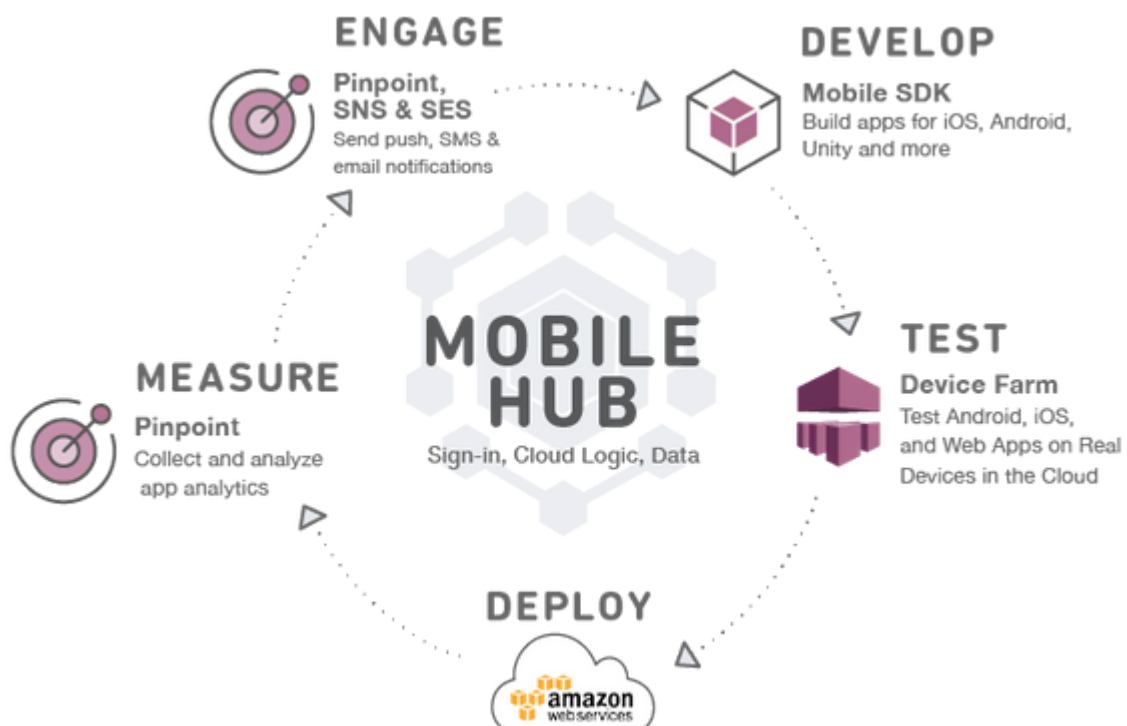

Mobile Hub: is a management console for all your mobile needs. It generates a cloud configuration file, which stores information about configured services.

Pin Point: This basically is to send targeted push notifications for your mobile users.

AWS – AppSync updates the data on mobile and web applications in real time. Also used for updating the data for offline users who come online.

Device farm for testing your application across several devices. This is to test your applications across various OS like IOS, Android and also test across various form factors of the devices.

Mobile Analytics mobile analytics service for the mobile.

AR/VR

Sumerian helps in creating and run virtual reality (VR), augmented reality (AR), and 3D applications quickly and easily without requiring any specialized programming or 3D graphics expertise.
