

Exercise: Clear Message Field

Alter the Skypey app so that the text in the message field is clear after submission.

Here's what the current progress of things look like when I write Hello! and submit three times.

It would be nice to clear the value of the input when submitted. This way the user gets some immediate feedback that their input has been submitted.

This is what you have to implement in the Skypey app given below. It is a very simple exercise.

You should be asking yourself which part of the app handles our typing field?

Remember, an empty field just implies that an empty string is returned

Remember, an empty field just implies that an empty string is returned.

Good luck!

```
import { createStore } from "redux";
import rootReducer from "../reducers";

const store = createStore(rootReducer);

export default store;
```

Solution:

This is an easy fix.

We are already dispatching a `SEND_MESSAGE` action. We can listen for this action and clear the input value in the typing.js reducer.

Let's do just that.

Add this within the switch block of the typing.js reducer:

```
case SEND_MESSAGE:
  return "";
```

Which brings all the code to this:

reducer/typing.js

```
import { SET_TYPING_VALUE, SEND_MESSAGE } from "../constants/action-types";
export default function typing(state = "", action) {
  switch (action.type) {
    case SET_TYPING_VALUE:
      return action.payload;
    case SEND_MESSAGE:
      return "";
    default:
      return state;
  }
}
```

And that's it! The message field will now be cleared when a message is sent.
