

# Wrapping Up

Polishing up our form component

WE'LL COVER THE FOLLOWING ^

- Changelist

Let's wrap up by putting the finishing touches of styling onto our feature-packed form!

There are all sorts of subtle things that make a form user experience excellent. For example, a slight hover effect to make it dead-obvious to the user that they're able to click to modify the input.

Output
JavaScript
HTML
CSS (SCSS)

## Changelist #

- Add focus and hover effects to let the user know which element they're about to edit and which element they're currently editing.
- Apply reasonable CSS to the month selector.
  - Add a little box-shadow to make it look like it's popping out of the page (distinct from the rest of the form).
- Apply CSS to the individual list items in the month selector
- Increase the height of each input a little bit.
- Increase the line height and font size of the month selector to match the other inputs.
- Other misc CSS changes

That's a reasonable place to end our auto validating input. Thanks for following along!
