

Coding Challenge #1: Showing a Node's Child

In this coding exercise, you have to complete the given code to show one of the given node's child.

Your mission here is to create a `showChild()` function that shows one of the children of a DOM element node. This function takes as parameter the parent node and the child node index. Error cases like a non-element node or an out-of-limits index must be taken into account.

Complete the following program to obtain the expected results. The associated HTML code is given in the HTML tab.

Note: Before testing your code, please run the code by pressing **RUN** button. Then, you can click **TEST** button. Otherwise, the test cases won't pass even if the code is correct.

Output

JavaScript

HTML

A title

Some text with [a link](#).
