

Exercise Solution

We were trying to refactor our User Card app using Redux. Below, I've written a simple solution:

```
const reducer = state => {  
  return state;  
};  
  
export default reducer;
```

Just as we discussed, our render function now accesses the store to get the state object of our app.

Since we're not making any alterations, **the reducer merely returns the state.**

```
const reducer = state => {  
  return state;  
};
```

That's it for our User Card.

Nothing fancy here, but be patient. We'll be doing a lot more than just refactoring as the course goes on.
