

Solution Review: Tuples from Records

This lesson explains the solution for the tuples from records exercise.

WE'LL COVER THE FOLLOWING ^

- Solution
- Explanation

Solution

```
type personalInfo = {  
  name: string,  
  age: int,  
  city: string  
};  
  
let mario = {  
  name: "Mario",  
  age: 50,  
  city: "Mushroom Kingdom"  
};  
  
let infoTuple = (person: personalInfo) => {  
  (person.name, person.age, person.city);  
};  
  
Js.log(infoTuple(mario));
```

Explanation

In the `infoTuple()`, we can use the `.` operator to access the different fields of the `mario` record. After that, we just need to create a tuple with the correct order and return it from the function.
