

How does the Profiler Work?

Let's figure how Profiler works in this lesson.

WE'LL COVER THE FOLLOWING ^

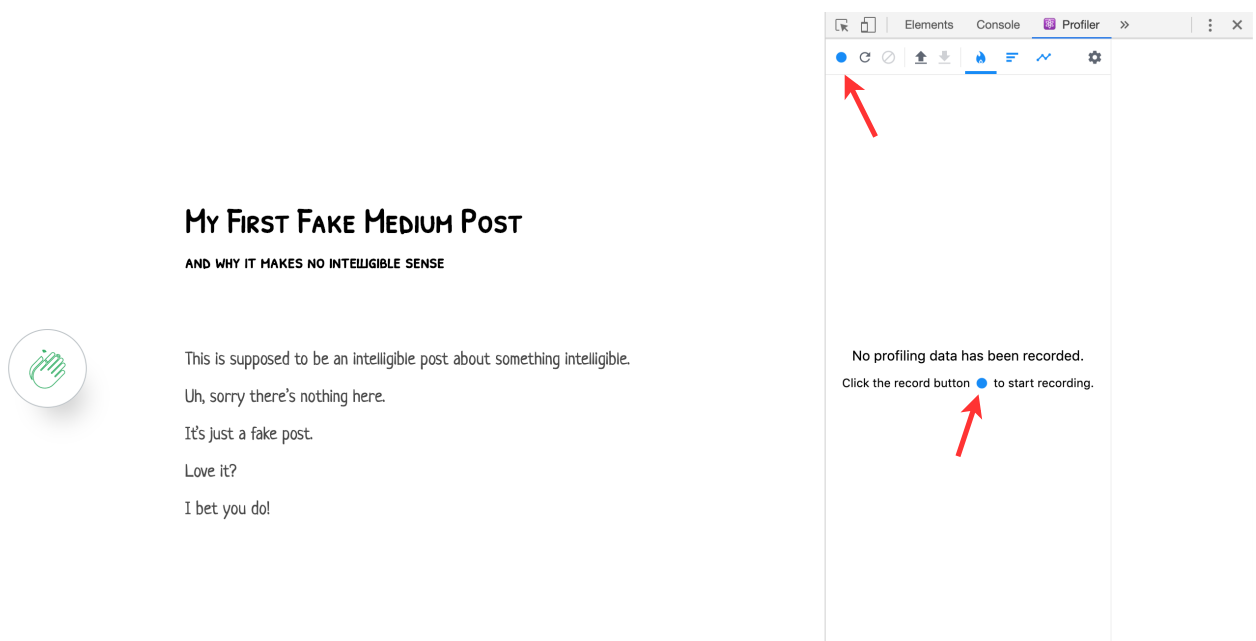

- Record a Session First
- Start the Recording
- Stop the Recording

Record a Session First

The Profiler works by recording a session of your application in use. In this recording, it gathers information about the components of your application and displays some interesting information you can exploit to find performance bottlenecks.

Start the Recording

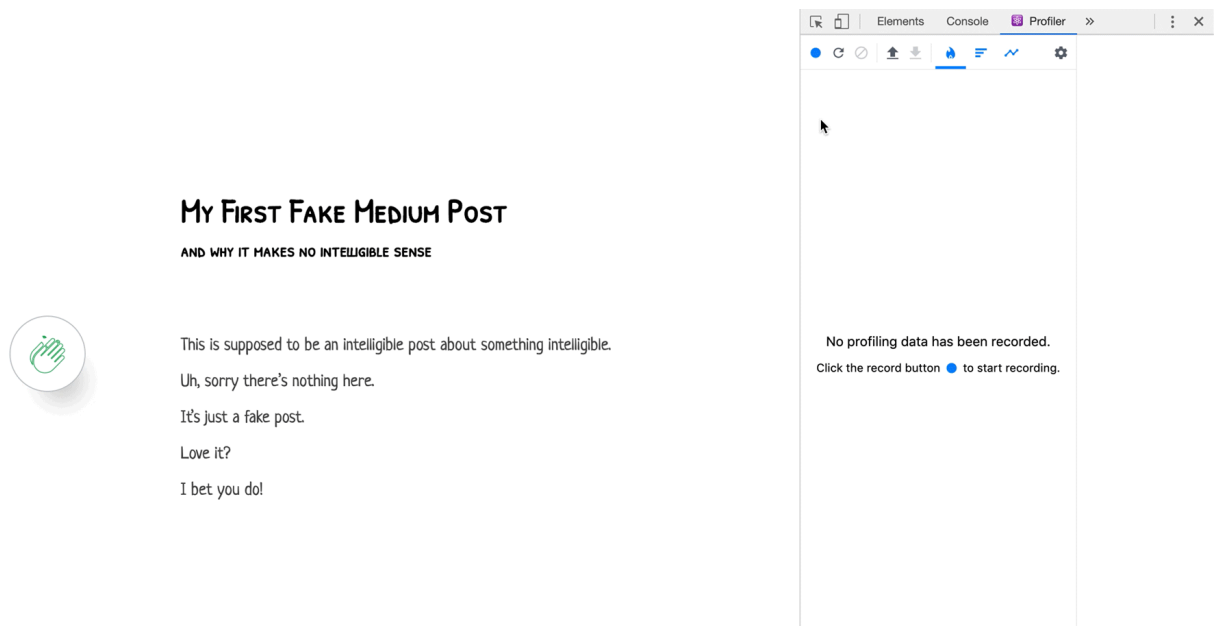

To get started, click the record button.

After clicking 'record', go ahead and use your application as you'd expect a

user to.

In this case, I've gone ahead to click the medium clap button 3 times!

Stop the Recording

Once you're done interacting with your application, hit the red dot to stop recording and view the information the Profiler provides.

In the next lesson, we'll check the results and make sense of them.
