

Detect Whether a Font is Installed

There will be times when you will want to know whether a particular font is available on a user's machine. Check out (and play with) the following example:

Click on the check button to see if Times New Roman is installed on your system. You can also replace the default *Times New Roman* text with the name of another font you are curious about and painstakingly click on the check button again. If the font you specified exists, you will see a dialog telling you so:

If the font you specified does not exist, a dialog will tell you that also. All of this is done entirely using just a few lines of JavaScript with no shenanigans involving applying/removing styles or modifying the DOM.
