

Viewing Beginning and Ending Contents of Files

Learn the commands to display the beginning and ending contents of any file.

We can use `head` and `tail` to view beginning and ending contents of file.

head:

Definition:

`head`, by default, prints the first 10 lines of each file to standard output. It reads the first few lines of any text given to it as an input and writes them on the display screen.

Syntax:

```
head [options] [file(s)]
```

Options:

Option	Description
<code>-n</code>	It can be used followed by an integer representing the number of lines to be displayed.
<code>-c</code>	This option can be used followed by the number of bytes desired.
<code>-q (quiet)</code>	Never print headers identifying file names.
	Always print headers identifying

-v (verbose)

Always print headers identifying
file names.

Example:

- To display first 15 lines from a file:

```
head -n 15 myFile.txt
```

A terminal window interface. On the left, a sidebar shows a file list with 'main.sh' selected and 'myFile.txt' below it. The main area displays the command 'head -n 15 myFile.txt' in a light gray box. At the bottom, there is a blue play button, a save icon, a back arrow, and a window control icon.

- To display first 5 lines from both files:

```
head -n 5 file1 file2
```

A terminal window interface. On the left, a sidebar shows a file list with 'main.sh' selected, 'file2' below it, and 'file1' at the bottom. The main area displays the command 'head -n 5 file1 file2' in a light gray box. At the bottom, there is a blue play button, a save icon, a back arrow, and a window control icon.

- To display first 10 lines of the three files: “file1.txt”, “file2.txt” and “file3.txt”:

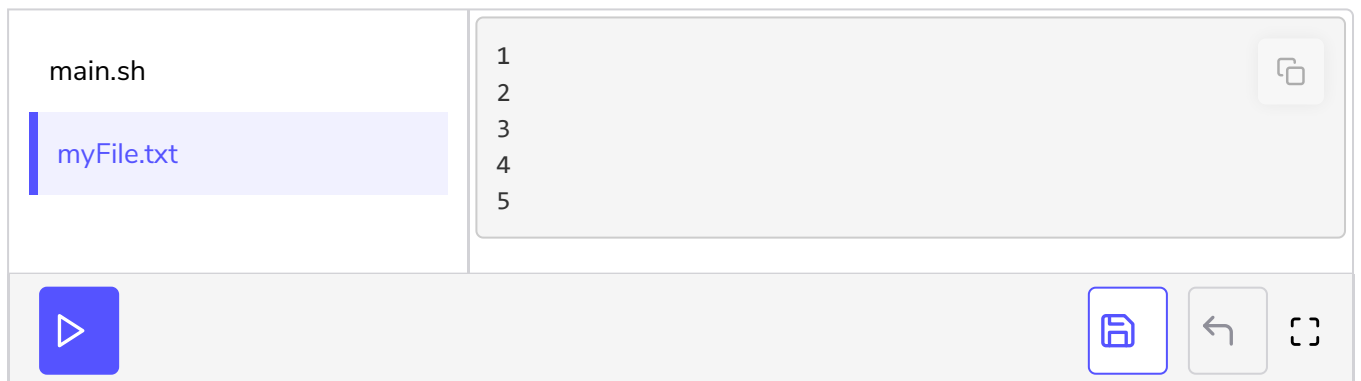

```
head file1.txt file2.txt file3.txt
```

A terminal window interface. On the left, a sidebar shows a file list with 'main.sh', 'file3.txt' (selected), 'file2.txt', and 'file1.txt'. The main area displays the command 'head file1.txt file2.txt file3.txt' in a light gray box. At the bottom, there is a blue play button, a save icon, a back arrow, and a window control icon.

- To display the first 5 bytes of myFile.txt:

```
head -c 5 myFile.txt
```

tail

Definition:

tail reads the last few lines of any file or text given to it as an input and writes them to the standard output.

Syntax:

```
tail [options] [file(s)]
```

Options:

Option	Description
-n	It is followed by an integer indicating the number of lines that are to be printed.
-c	To print the specific number of bytes. this option precedes the number of bytes.

-q (quiet)	It causes tail to not print the file name before each set of lines and to eliminate the vertical space between each set of lines when there are multiple input sources.
-v (verbose)	It causes tail to print the file name even if there is just a single input file.

Examples:

- To print the last 10 lines of the files named “file1.txt” and “file2.txt”:

```
tail file1.txt file2.txt
```

main.sh
file2.txt
file1.txt

tail file1.txt file2.txt

- To display last 3 lines of a file, “file.txt”:

```
tail -n 3 file.txt
```

main.sh
file.txt

tail -n 3 file.txt

- To print the last 3 kilobytes of the file “file.txt”:

```
tail -c 3 file.txt
```

main.sh

file.txt
