

Installing Vue Application Locally

This lesson is optional. It will teach you how to setup Vue application locally.

WE'LL COVER THE FOLLOWING ^

- Getting Started

Getting Started

Create a new project using `vue-cli`. You have to answer “no” to all yes/no questions.

```
npm install -g vue-cli
vue init webpack vue-test
cd vue-test
```

Then install some dependencies:

```
# Install dependencies
npm i -D jest vue-jest babel-jest
```

The command above installs `jest-vue-preprocessor` and `babel-jest`.

`jest-vue-preprocessor` is needed for Jest to understand `.vue` files, and `babel-jest` for the integration with Babel.

Next, install `vue-test-utils` from `npm` using the following command:

```
npm i -D @vue/test-utils
```

That's it. Good Luck :)
