## Quiz

A short quiz to test your understanding of constructor functions in OOP in JavaScript.

All objects created from a constructor function contain all the properties in it?

Point out the error in the code below:

```
function Shape(name, sides) {
  name: name
  sides: sides
}
var square = new Shape('Square', 4)
```

Code in the constructor function executes every time a new object is instantiated.

this refers to the new object created and is used to set its property values.

What will be the result of the following code?

```
function Shape(name, sides){
  this.name = name
  this.sides = sides
}

Shape.length = 4
var shape1 = new Shape('Square', 4)
console.log("Length is:", shape1.length)
```
