- Exercise

Let's solve an exercise in this lesson.

```
we'll cover the following ^
• Try lt Out!
```

Try It Out!

Use my MyDouble in your program.

- How can you be sure that instances of MyDouble are created at compile time?
- What happens, if the instances of my MyDouble are used in non-constexpr contexts?

```
#include <iostream>

struct MyDouble{
   double myVal;
   constexpr MyDouble(double v): myVal(v){}
   constexpr double getVal(){
     return myVal;
   }
};

int main() {
   // try to call non-constexpr myDouble instance
}
```

In the next lesson, we'll study constexpr if.
