### **Control Flow**

In this lesson, we will learn how to add control flow blocks in the Jinja templating language.

# WE'LL COVER THE FOLLOWING ^ Introduction Loops Conditionals

### Introduction #

Jinja also provides syntax to handle the control flow of the application inside its templates. Loops and conditions can be added to the templates using a pythonic syntax provided by Jinja.

# Loops #

The syntax of for loops in Jinja is very similar to pythonic syntax.

```
{% for elements in array %}
...
{% endfor %}
```

```
Note: You must always end the for loop using {% endfor %}.
```

Consider the example of a dictionary we covered in the last lesson. If we want to traverse the whole dictionary we can do it as follows:

```
(/iieau/
<body>
 Index
    Username
    Location
  {% for username, location in users.items() %}
  {{loop.index}}
    {{username}}
    {{location}}
  {% endfor %}
</body>
</html>
```

## Conditionals #

Similarly, conditional statements can be added using pythonic syntax like so:

```
{% if true %}
{% endif %}
```

```
Note: You have to always end the if condition using {% endif %}.
```

For multiple branches of conditions, elif and else can be used.

```
{% if ... %}
{% elif ... %}
{% else %}
{% endif %}
```

Let's once again consider the example mentioned above. If we only want to show the users at the location equal to Los Angeles. Then the code will become:

In the next lesson, we will learn about a very compelling feature of Jinja; **template inheritance**. Stay tuned!
