## Open MP - clauses

The table below summarizes which **clauses** are accepted by which OpenMP **directives**.

Clause	Description
copyin	Allows threads to access the master thread's value, for a threadprivate variable.
copyprivate	Specifies that one or more variables should be shared among all threads.
default	Specifies the behavior of unscoped variables in a parallel region.
firstprivate	Specifies that each thread should have its own instance of a variable, and that the variable should be initialized with the value of the variable, because it exists before the parallel construct.
if	Specifies whether a loop should be executed in parallel or in serial.
lastprivate	Specifies that the enclosing context's version of the variable is set equal to the private version of

whichever thread executes the final iteration (for-loop construct) or last section (#pragma sections). Overrides the barrier implicit in a nowait directive. Sets the number of threads in a num threads thread team. Required on a parallel for-loop statement if an **ordered** directive ordered is to be used in the **loop**. Specifies that each thread should private have its own instance of a variable. Specifies that one or more variables that are private to each thread are the subject of a reduction reduction operation at the end of the parallel region. Applies to the for directive. schedule Specifies that one or more variables should be shared among shared all threads.
