Solution Review: Find the Minimum in an Array

This lesson explains the solution for the find the minimum in an array exercise.

WE'LL COVER THE FOLLOWING ^SolutionExplanation

Solution

```
let arr = [| 23, 45, 17, 10, 60, 54 |];
let findMin = (arr: array(int)) => {
  let min = ref(-1);
  min := arr[0]; /* Start with the first value of the array */
  for (i in 1 to Array.length(arr)-1) { /* Travrse the array */
    if (min^ > arr[i]) { /* Whenever a value smaller than min is found */
        min := arr[i]; /* Make it the new min */
    };
};
min^;
};
Js.log(findMin(arr));
```

Explanation

The for loop is the best choice for this problem, as it allows us to easily traverse an array. Initially, we set the value of our mutable min as the first element of the array.

After that, we update the value of min whenever a smaller value is found. By this logic, we will have the smallest value from the array at the end of the

loop.
