React JSX

Recall that I mentioned the returned output of the App component resembles HTML. This output is called JSX, which mixes HTML and JavaScript. Let's see how this works for displaying the variable:

```
.App {
 text-align: center;
.App-logo {
 animation: App-logo-spin infinite 20s linear;
 height: 80px;
}
.App-header {
  background-color: #222;
 height: 150px;
 padding: 20px;
 color: white;
}
.App-title {
  font-size: 1.5em;
.App-intro {
 font-size: large;
@keyframes App-logo-spin {
 from { transform: rotate(0deg); }
  to { transform: rotate(360deg); }
}
```

Start your application with npm start again, and look for the rendered variable in the browser, which should read: "Hello React".

Let's focus on the HTML, which is expressed almost the same in JSX. An input field with a label can be defined as follows:

Note: In the app onwards we can now see the output in the browser

server, which will then begin to listen for any changes made in our code files.

since we are starting the app using npm start. This will start the live-

See the output in action, both in the **output tab** and the **host link** provided below. In case of any changes you make to your code, the liveserver will detect these, just press **Run**.

Note: The terminal remains alive for 30 minutes for each session, after which the server is killed;

We specified three HTML attributes here: htmlFor, id, and type. Where id and type should be familiar from native HTML, htmlFor might be new. The htmlFor reflects the for attribute in HTML. JSX replaces a handful of internal HTML attributes, but you can find all the supported HTML attributes in React's documentation, which follow the camelCase naming convention. Expect to come across more JSX-specific attributes like className and onClick instead of class and onclick, as you learn more about React.

We will revisit the HTML input field for implementation details later; for now, let's return to JavaScript in JSX. We have defined a string primitive to be displayed in the App component, and the same can be done with a JavaScript object:

```
IHDR
            (-□S
            IHDR
?^q֖íÛ□ï.},□ìsæÝ_TttÔ% □1#□□/(ì□-[□□□è`□è`Ì□ÚïÅðZ□d5□□□□?ÎebZ¿Þ□i.Ûæ□□□ìqÎ□+1°□}Â□5
                    D¤□Æ □APLTE
 IHDR
                     □·□ì □:PLTE
 IHDR
       @ 🗆 🗆
¢BqÇ8Ù□´□mK˱mƶmÛü·yi!è□ΪYÏuë ÀÏ_Àï?i÷□ý+ò□□ÄA□|□ù{□□´?¿□_En□).□JËD¤<□
@¢Z\Ts@R*□(□ ¯@□J□□□□u□X/□4J□9□¡5·DEμ4kÇ4□&i¥V4Ú□;®Đ□□¯□vsf:àg,□¢èBC»î$¶□ºÍùî□□á□@
-ê>Û□º«¢XÕ¢î}ߨëÛÑ;□ÃöN´□ØvÅý□Î,ÿ1 □ë×ÄO@&v/Äþ_□ö\ô□Ç\í.□□½+0□□;□□□!□fÊ□¦´Ó% JY·O□Â□
```

Remember, everything in curly braces in JSX can be used for JavaScript expressions (e.g. function execution):

```
ã□
                  )□
                        9□
                          5□ @@ □
                                °□ n□
                                    □PNG
IHDR
          ?^q֖íÛ□ï.},□ìsæÝ_TttÔ% □1#□□/(ì□-[□□□è`□è`Ì□ÚïÅðZ□d5□□□□?ÎebZ¿Þ□i.Ûæ□□□ìqÎ□+1°□}Â□5
                 D¤□Æ □APLTE
 IHDR
      @ 🗆 🗆
          □·□ì □:PLTE
¢BqÇ8Ù□´□mK˱mƶmÛü·yi!è□ΪYÏuë ÀÏ_Àï?i÷□ý+ò□□ÄA□|□ù{□□´?¿□_En□).□JËD¤<□
-ê>Û□º«¢XÕ¢î}ߨëÛÑ;□ÃöN´□ØvÅý□θÿ1 □ë×ÄO@&v/Äþ_□ö\ô□Ç\í.□□½+0□□;□□□!□fÊ□¦´Ó% JY·0□Â□
```

JSX was initially invented for React, but it became useful for other modern libraries and frameworks after it gained popularity. It is one of my favorite things about React. Without any extra templating syntax (except for the curly braces), we are now able to use JavaScript in HTML.

Exercises:

- Confirm the changes from the last section.
- Read more about React's JSX.
- Define more primitive and complex JavaScript data types and render them in JSX.
- Try to render a JavaScript array in JSX. If it's too complicated, don't worry, because you will learn more about this in the next section.
