vmin and vmax

While vh and vw are related to the viewport's height and width, vmin and vmax are related to the minimum and maximum of these values. It does depend on which is larger or smaller.
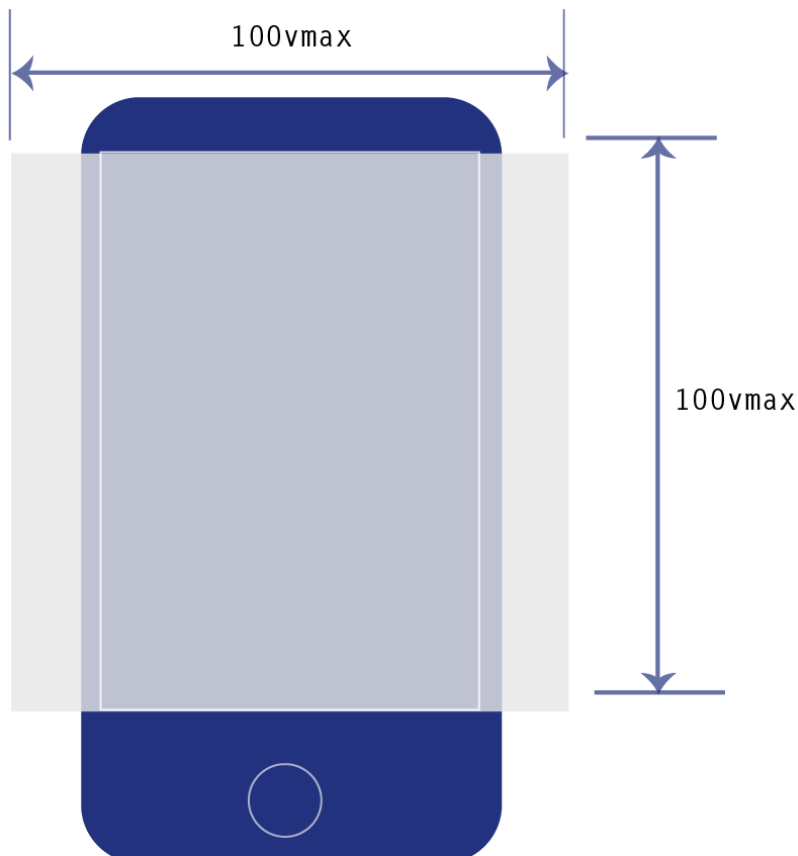

If we had a screen size of `750px` by `300px`, which is the larger of these values?
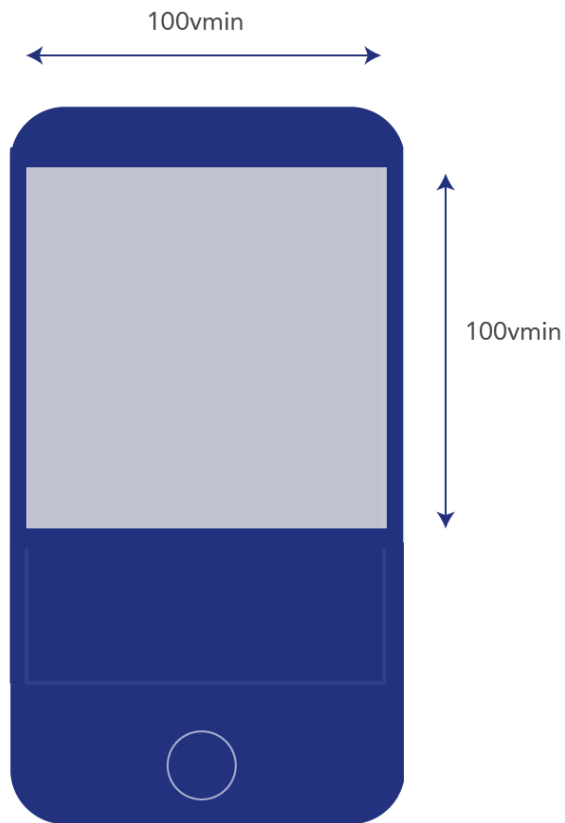

`750px` of course. Everyone knows that :-)

In this case `100vmax` would represent the `750px`, the larger of the viewport's dimensions.

`100vmin` also would represent `300px`, the smaller of the viewport's dimensions.

Below is a simple illustration to buttress this point.

The illustrations above are cool, right? Self explanatory.

It took some time to make those for you. I hope they help you understand things better.
