Interesting Experiments

You can get a stronger grasp on your knowledge and understanding by doing the interesting experiments that have been listed in this lesson!

- Try deploying the stack again using the same name.

- Try creating a new stack, using a different name, from the same output template (you don't need to build and package again, just deploy under a new name).

- Try changing the response message in the Lambda function source and update only one of the deployed stacks, then compare the results.

- Try updating a stack with a broken CloudFormation output template, for example by modifying the `CodeUri` for the function to point to an invalid URL directly in `output.yaml` before deploying. Observe the deployment in the AWS Web Console and see how CloudFormation restores it to the last known working state.

- Run `aws cloudformation help` to see the full list of available CloudFormation tools, then experiment with some of them. For example, try deleting one of the deployed stacks.

Get ready for a quick quiz in the next lesson!
