Summary

Here's a summary of everything we learned in this chapter!

This chapter showed how to use two sets of functions `from_chars` - to convert strings into numbers, and `to_chars` that converts numbers into their textual representations.

The functions might look very raw and even C-style. This is a "price" you have to pay for having such low-level support, performance, safety, and flexibility. The advantage is that you can provide a simple wrapper that exposes only the needed parts that you want.

> *Extra Info:* The change was proposed in: P0067.

Now that you've reached the end of the chapter and learned all the concepts. It's time for a short quiz to test your understanding. Move on to the next lesson to attempt it.
