Project Challenge: Retrieving a User at Login

In this challenge, we will be modifying the login function to retrieve an inserted user from the database.

Problem statement

In this challenge, we will modify the `login` method so that it retrieves the required `user` from the database instead of searching in the list.

> 📌 **Note:** we have already inserted one `user` in the database for you. This is the **admin** user. You can see the insertion on **lines 31 to 41**. You can use this `user` to test out the modified `login` method.

You will perform the following tasks:

1. Modify the `login` method to check for the `user` in the database and then authenticate it.

2. Next, instead of storing the `user` object in the `session`, only store the `id` of the user in the `session`.

Your implementation

Implement the features described above in the application provided below.

> ⚠ **Disclaimer:** Please do not remove the `users` and `pets` list from the application yet, as it may break the existing features of the application.

```python
"""Flask Application for Paws Rescue Center."""
from flask import Flask, render_template, abort
from forms import SignUpForm, LoginForm
from flask import session, redirect, url_for
from flask_sqlalchemy import SQLAlchemy

app = Flask(__name__)
app.config['SECRET_KEY'] = 'dfewfew123213rwdsgert34tgfd1234trgf'
app.config['SQLALCHEMY_DATABASE_URI'] = 'sqlite:///paws.db'
db = SQLAlchemy(app)

"""Model for Pets."""
class Pet(db.Model):
    id = db.Column(db.Integer, primary_key=True)
    name = db.Column(db.String, unique=True)
    age = db.Column(db.String)
    bio = db.Column(db.String)
    posted_by =  db.Column(db.String, db.ForeignKey('user.id'))

"""Model for Users."""
class User(db.Model):
    id = db.Column(db.Integer, primary_key=True)
    full_name = db.Column(db.String)
    email = db.Column(db.String, unique=True)
    password = db.Column(db.String)
    pets = db.relationship('Pet', backref = 'user')

db.create_all()

# Create "team" user and add it to session
team = User(full_name = "Pet Rescue Team", email = "team@petrescue.co", password = "adminpass
db.session.add(team)

# Commit changes in the session
try:
    db.session.commit()
except Exception as e:
    db.session.rollback()
finally:
    db.session.close()

"""Information regarding the Pets in the System."""
