Solution Review: Lower To Uppercase

This lesson will help you change the case of the string using a built-in function.

Solution: Use `str.upper()` and `str.lower()`

Given a string "str", use `str.upper()` to convert the string 'str' to **upper case**, and use `str.lower()` to convert string 'str' to **lower case**.

For example,

Given a string

```
str = "AAA bbb CCC"
a = str.upper()
b = str.lower()

Output:
AAA BBB CCC
aaa bbb ccc
```

The following python code demonstrates how to change the letter case of a string.

```
def changeCase(s):
  a = s.upper()  # convert string to "AAA BBB CCC"
  b = s.lower()  # convert string to "aaa bbb ccc"
  return [a, b]

str = "AAA bbb CCC"
print(changeCase(str))
```

Now that you have solved challenges on numbers and strings, let's move on to the quiz.
