# Removing Object Properties

In this lesson, we will see how to remove certain properties from an object.

The delete construct

JavaScript provides the delete construct to remove properties from objects. This code demonstrates the usage:

```
var myObject = new Object();
myObject.intProp = 23;
myObject.strProp = "Hi!";

console.log(myObject.intProp); // 23
console.log(myObject.strProp); // Hi!

delete myObject.intProp;

console.log(myObject.intProp); // undefined
```

```
console.log(myObject.strProp); // Hi!
```

The code sets up the `myObject` instance with two properties, `intProp` and `strProp`. The delete statement removes `intProp` from `myObject` so that the second time it is written to the console it contains undefined.

In the *next lesson*, we will see how to instantiate an object.

See you there! :)
